

2022 Proposed CCFRP Otolith Collections

Melissa H. Monk

February 16, 2022

1 First Pass at Determining 2022 Otolith Collections

The following use only data from 2018, 2019 and 2020 from the reference areas. Drifts that did not see any of the target species are also excluded. I also excluded the following MPA locations, Farallons, Point Conception, Laguna Beach, Trinidad and “BM” (error?).

As a first pass, I looked at the total number of a given species by north and south of Point Conception. I did this because we have been separating assessments at Point Conception for most of the nearshore species, and species compositions and fishing practices are fundamentally different in these two regions.

If there were fewer than 4 of a given species seen across the three years, I excluded them from the collections analysis. I also removed yelloweye rockfish and the olive or yellowtail rockfish category.

I then took the ratios of a species within by CCFRP institution and scaled that to either a collection total for each region of 50 samples (otoliths) or 70% of the total. In an assessment model, we usually exclude any age data with fewer than 30 samples per year.

I realize that we need to scale back some of the collections by programs, e.g., BML, and also figure out if we should lingcod. The NWFSC is currently exploring a comparison of lingcod otoliths reads with spine. Collection of spine is a bit more difficult. There is also an interest in developing post-fillet back calculations for lingcod. What I’d like to hear from each partner, is the maximum number of otoliths you think you could possibly collect. We will also have staff available to process fish (as long as COVID trends the right direction).

For species that are less common, otoliths can still be used to look at growth curves, e.g. copper and quillback this cycle.

I will clean up the tables below and look at a few other metrics including available habitat in the reference sites for each university’s site to make sure we’re scaling samples appropriately.

This document lives on my Github page and will allow us to reproduce these values as a moving window going forward, and also adjust according to assessment prioritization. The Council will decide a preliminary assessments for the odd year in the prior even year, with final decisions coming in June. That should give us time to adjust these numbers for special collections.

We also have an interest in fin clips, especially for vermilion/sunsets and also blue/deacons.

Table 1: Total angler hours by institution summed across 2018, 2019, 2021.

YEAR	BML	Cal Poly	HSU	MLML	SIO	UCSB
2018	179	188	71	175	103	128
2019	199	172	66	187	121	121
2021	110	112	66	161	51	173

Table 2: Total effort in 2021

Monitoring.Group	Total_AnglerHours	Percent_Effort
BML	110	16%
Cal Poly	112	17%
HSU	66	10%
MLML	161	24%
SIO	51	8%
UCSB	173	26%

Table 3: Total effort in 2018

Monitoring.Group	Total_AnglerHours	Percent_Effort
BML	179	21%
Cal Poly	188	22%
HSU	71	8%
MLML	175	21%
SIO	103	12%
UCSB	128	15%

Table 4: Suggested otolith collections for 2022 CCFRP by species and CCFRP partner

Common.Name	BML	Cal Poly	MLML	HSU	UCSB	SIO	Total
Black-and-Yellow Rockfish	7	4	7	0	0	0	18
Black Rockfish	13	1	29	9	0	0	52
